Summary

DevSecOps and cloud security engineer who builds and ships real systems. Since 2024 I have designed, secured, and deployed production applications across Google Cloud and AWS, working end to end from backend code to live cloud infrastructure. My main project, AgentSec, is a multi tenant security SaaS that I built and run myself. I work in Python and FastAPI, with PostgreSQL, Docker, GitHub Actions, Terraform, and Ansible, and I treat security as part of the build rather than an afterthought. All of my work is public and most of it is live, so it can be reviewed or logged into directly.

Flagship Project

AgentSec - Autonomous DevSecOps SaaS (founder and sole engineer)

Live application and public source code, built and operated solo

- Live app <https://ashtech.app>
- Source code <https://github.com/ashNikov/devsec-agent>
- Multi tenant SaaS that automatically detects and remediates exposed secrets and cloud misconfigurations for small engineering teams, scanning connected GitHub repositories and opening real fixes through the GitHub API.
- Built secure authentication with JWT and GitHub OAuth, plus role based access that separates organisation owners from platform admins and scopes every tenant strictly by organisation, with cross tenant access proven to be blocked.
- Designed the PostgreSQL database schema and run all migrations through Alembic, with Terraform provisioning the cloud infrastructure and Ansible handling configuration so nothing is set up by hand.
- Integrated third party services including a payment gateway (Paystack), transactional email, and AI APIs, including a cross provider analysis engine that runs two models from different providers (Gemini and Claude) and reconciles their output with a scoring judge.
- Runs on Google Cloud using Cloud Run and Cloud SQL, deployed through GitHub Actions, with all secrets held in GCP Secret Manager rather than plain environment variables.
- Handle the full operational side myself: scrubbed git history with git filter repo, rotated leaked credentials, set up uptime monitoring with alerting, and diagnosed and fixed a production memory issue directly from logs.

Cloud and DevOps Experience

Self directed DevSecOps and Cloud Engineering (2024 to present)

Daily hands on cloud work building and deploying production projects

- Worked hands on with AWS every day from August to December 2024, hosting and deploying three of my own applications (AshFlix, FootyIQ, ProphecyForge) using AWS services for live cloud hosting.
- Moved current work to Google Cloud, where AgentSec and a community price intelligence project both run on Cloud Run, Cloud SQL, and related managed services.
- Build and maintain CI and CD pipelines with GitHub Actions for automated builds, testing, secret scanning, and deployment.
- Apply DevSecOps practices throughout: secret scanning with Gitleaks, vulnerability scanning with Trivy, code quality gates with SonarCloud, secure container images, and least privilege IAM.

- Use Terraform for infrastructure as code and Ansible for configuration management, with a strict rule that infrastructure is provisioned and configured through code, not manual steps.
- Worked with Kubernetes (Minikube, ingress, TLS) and am actively integrating a Kubernetes component into AgentSec.

Other Projects

- AshFlix - AI streaming SaaS, hosted on AWS. <https://github.com/ashNikov/ashflix>
- FootyIQ - football predictions SaaS, hosted on AWS. <https://github.com/ashNikov/footyiq-saas>
- ProphecyForge AI - AI project, hosted on AWS. <https://github.com/ashNikov/prophecyforge-ai>
- Price Transparency - community price intelligence platform for Nigerian markets, built on Google Cloud. <https://github.com/ashNikov/price-transparency>

Most of these projects have a README on GitHub describing the build and the stack.

Technical Skills

Languages and frameworks - Python, FastAPI, Bash, JavaScript and TypeScript, Next.js

Cloud - Google Cloud (Cloud Run, Cloud SQL, Secret Manager, Monitoring), AWS

Databases - PostgreSQL, with Alembic migrations

Containers and CI/CD - Docker, GitHub Actions, Kubernetes (working knowledge)

Infrastructure as code - Terraform, Ansible

Security - JWT and OAuth, secret scanning (Gitleaks), vulnerability scanning (Trivy), SonarCloud, secret management, IAM

Auth and APIs - RESTful API design, JWT, OAuth, role based access control

Tools - Git, Linux (WSL2), VS Code

A Note on Stack

My production stack is Python and FastAPI rather than Node.js. I have not shipped a large Node codebase, but the work itself, secure REST APIs, authentication, database design, third party and AI integrations, and deployment, is what I do every day, and I can pick up Node and its frameworks quickly. I would rather state this plainly than have it come as a surprise.

Additional Information

Language - English

Interests - Chess (Lichess bullet, rated 1400 plus), cloud security, emerging technology
